

PostScript has dynamic scoping.

Postscript uses stacks to interpret

The operand stack - the primary stack used for most computation, sometimes just called “the stack”

**The dictionary stack - a stack used to save and store dictionaries, All names in the program are defined
And their definition placed into a dictionary**

Constants - numbers, strings, booleans, code, names

-3 #integer

-(this is a string) #the string

-3.4 #real number 3.4

-false,true #boolean values false and true

-/x #name constants

- [3 2 +] #code block

- x #variable
